

# Accurately Mapping Third-party Tool Results into ACE

Daniel Garcia, Tecolote Research, Inc. Steve Sultzer, Galorath, Inc.

Los Angeles = Washington, D.C. = Boston = Chantilly = Huntsville = Dayton = Santa Barbara
 Albuquerque = Colorado Springs = Ft. Meade = Ft. Monmouth = Goddard Space Flight Center = Ogden = Patuxent River = Silver Spring = Washington Navy Yard
 Cleveland = Dahlgren = Denver = Johnson Space Center = Montgomery = New Orleans = Oklahoma City = Tampa = Tacoma = Vandenberg AFB = Warner Robins ALC

### The Presenters

#### Daniel Garcia

- Sr. Analyst with Tecolote Research
  - > 8+ years in the Los Angeles Division
  - > Global Positioning System Wing, Deputy Task Manager
- ACEIT Instructor

#### Steve Sultzer

- Sr. Consultant with Galorath, Inc.
  - > 4+ years supporting the Los Angeles Division of Tecolote
  - Primarily supports GPS Wing

- ACE supports third-party tools very well
  - Parametric estimation tools (such as SEER tool suite)
  - Risk/Statistical tools (such as @Risk and Crystal Ball)
- The results from these tools can be brought into ACE manually (typing the results into ACE) or in some automated fashion (e.g. using the Excel-to-Ace plug-in)
- This presentation will focus WHY and HOW to use the results from third-party tools in ACE

### **SEER Parametric Models**

- SEER suite of tools are parametric models that estimate the cost, effort, and schedule for the development and production of hardware and software
- Model of interest in this discussion is the SEER model for estimating software (SEER-SEM)
  - There also exists SEER models for estimating hardware (SEER-H), and Integrated Circuits (SEER-IC)
- Estimates generated with the SEER models will frequently be used as inputs into the ACEIT model in building a complete system estimate

The process employed in this example uses SEER results, but can be used with results from any third-party tool

There is an issue with using the standard distributions within ACE

- The standard result for SEER configuration items with risk adjusted inputs is the 50% confidence level value (median)
- For non-Normal type distributions, ACE is expecting the Most Likely value (mode)
- Example: A Triangular Distribution

Why this is an issue ...

- Illustration will use examples from SEER
- If you enter the output from SEER models (the 50% confidence value or median) into ACE as the Most Likely value, you may introduce statistical error
- For SEER models (and many other parametric models), a Lognormal distribution will provide a very good approximation of the results in the 50% to 80% confidence level areas of the S-curve; However, outside of this range the results may be significantly different

User-defined Cumulative Distribution Function (CDF) capability in ACEIT 7.1a, allows the results from third party tools to be mapped very accurately into ACE

## **SEER Examples**

- Example will use SEER and will demonstrate challenges with using current guidance
- Three estimates
  - Estimate 1
    - 'Regular' right-skewed example
  - Estimate 2
    - Lower risk example
  - Estimate 3
    - High risk, highly right-skewed example

### 'Regular' right-skewed example

NOTIONAL DATA

GALORATH

**NOTIONAL DATA** 

# High risk, highly right-skewed

NOTIONAL DATA

### **User-defined Cumulative** Distribution Function (CDF)

#### New in ACEIT 7.1

- Allows the user to enter percentile/factor pairs to accurately describe a user-defined (or third-party model defined) risk distribution curve
- The percentile is the confidence level of the data point; the multiplier is the percentage of the 50% data point

#### Example: Distribution curve where,

- <u>% CL Value Percentage to PE (50%CL value)</u>
- 10% CL = 60 0.50, (60/120)
- 30% CL = 85 0.71, (85/120)
- 50% CL = 120 1.00, (120/120)
- 70% CL = 180 1.50, (180/120)
- 90% CL = 285 2.38, (285/120)

The CDF dialog allows the user to enter custom, specific Confidence Level % and Multiplier pairs to be entered

#### This information can be

- Input manually in ACE
  - "Fat-fingered"
  - Copy/Pasted
- Brought into ACE in an automated fashion using the Excel-to-ACE plug-in

#### Edit Custom CDF

#### Name: ACE25

Confidence and multiplier must be in ascending order. The next multiplier can be equal to the previous one. Confidence is percentage number between 0 and 100. Multiplier is a factor of the point estimate. For example, you may have 1.0 at 50% confidence and 1.25 at 75% confidence.

	Confidence (%)	Multiplier	-
1	1.00000000000	0.6800000000000	-
2	10.00000000000	0.6060000000000	
3	20.00000000000	0.7554800000000	
4	30.00000000000	0.8310280000000	
5	40.00000000000	0.9141308000000	
6	50.00000000000	1.0000000000000	
7	60.00000000000	1.1000000000000	
8	70.00000000000	1.2100000000000	
9	80.00000000000	1.3310000000000	
10	90.00000000000	1.4641000000000	
11	99.00000000000	1.6105100000000

Help

**Getting the SEER Output** 

- The easiest method of getting the risk information for each CSCI is by using the Flexible Export feature in SEER
- In the output section of the Flexible Export dialog are the risk outputs (Risk Development Schedule, Effort, and Cost)
- This feature will allow the user to output information to Excel quickly and easily

### Flexible Export Screen
