

### CECOM's Tips for Creating More Efficient Estimates

Tom Ferrante & Sonja Holzinger US Army Communications-Electronics Command (CECOM) G8 - Cost and Systems Analysis Division September 2012

#### Purpose

CECOM cost analysts utilize several sophisticated estimating methodologies in ACE to gain efficiencies. This presentation will address a few of those methodologies, and illustrate how they lead to more dynamic and powerful cost models

- Linking quantity schedules for Procurement, Fielding, and Sustainment
- Using matrices to simplify manpower cost calculations
- Using the "IF" function with ACEIT cases to simplify estimates for CBAs, BCAs, etc.

### Linking Quantity Schedules for Procurement, Fielding, and Sustainment

- The following statements are usually true about quantity schedules:
  - The Fielding (delivery) quantity schedule is the Production (buy) quantity schedule shifted out by some period of time (i.e. one year)
  - The Sustainment quantity schedule is the sum of the fielded quantities throughout the system life
  - It is more time consuming to maintain three quantity schedules in ACE than it is to build one

- Why is it advantageous to link schedules?
  - With unlinked schedules, quantity changes during what-if drills can result in significant rework for the analyst
  - If the quantity schedules are linked, the analyst is only required to change quantities in the Production (buy) quantity schedule, thus leading to more timely results
  - Fewer manual changes typically yield fewer errors

| 19 | PRODUCTION QUANTITY SCHEDULE               | ProdQty        |
|----|--|----------------|
| 20 | Variant 1                                  | ProdQtyVar1    |
| 21 | Variant 2                                  | ProdQtyVar2    |
| 22 |  |                |
| 23 | System Production to Fielding Lag in Years | lag            |
| 24 |  |                |
| 25 | FIELDING QUANTITY SCHEDULE                 | FieldQty       |
| 26 | Variant 1                                  | FieldQtyVar1   |
| 27 | Variant 2                                  | FieldQtyVar2   |
| 28 |  |                |
| 29 | System Operational Life                    | sys_life       |
| 30 |  |                |
| 31 | SUSTAINMENT QUANTITY SCHEDULE (Cumulative) | SustainQty     |
| 32 | Variant 1                                  | SustainQtyVar1 |
| 33 | Variant 2                                  | SustainQtyVar2 |

#### • ACE functions required:

- Fiscal Year Calculated Value FYCVal()
  - This function returns the calculated yearly value (or sum of yearly calculated values if more than one FY is specified) for a specified row
- Fiscal Year Year FYYR
  - This function returns as a value the fiscal year for each of the FY columns in your ACE session
- Operational Fielded Units OpFieldedUnits()
  - This function determines a time-phased fielded units in use through the current year based on a buy schedule, fielding lag and life expectancy

#### User-created variables required:

- Lag from Production to Fielding (in years)
- System Operational Life (in years)

|    | WBS/CES Description          | Phasing<br>Method | Approp | Lead<br>/Lag | FY 2012 | FY 2013 | FY 2014 | FY 2015 | FY 2016 |
|----|------------------------------|-------------------|--------|--------------|---------|---------|---------|---------|---------|
| 19 | PRODUCTION QUANTITY SCHEDULE |                   |        |              |         |         |         |         |         |
| 20 | Variant 1                    | IS                |        |              | 10      | 20      | 30      | 40      | 50      |
| 21 | Variant 2                    | IS                |        |              | 5       | 10      | 15      | 20      | 25      |

- Enter the Production quantity schedule in the Yearly Phasing Workscreen
  - This should be the only quantity schedule that needs to be entered manually

10

|    | WBS/CES Description                        | Unique ID    | Point<br>Estimate | Phasing<br>Method | Equation / Throughput            |
|----|--|--------------|-------------------|-------------------|----------------------------------|
| 18 |  |              |                   |                   |                                  |
| 19 | PRODUCTION QUANTITY SCHEDULE               | ProdQty      | 225.000 *         |                   |                                  |
| 20 | Variant 1                                  | ProdQtyVar1  | 150.000 *         | IS                | [Input Throughput]               |
| 21 | Variant 2                                  | ProdQtyVar2  | 75.000 *          | IS                | [Input Throughput]               |
| 22 |  |              |                   |                   |                                  |
| 23 | System Production to Fielding Lag in Years | lag          | 1.000 *           | С                 | 1                                |
| 24 |  |              |                   |                   |                                  |
| 25 | FIELDING QUANTITY SCHEDULE                 | FieldQty     | 225.000 *         |                   |                                  |
| 26 | Variant 1                                  | FieldQtyVar1 | 150.000 *         | F                 | FYCVAL(@ProdQtyVar1, FYYR - lag) |
| 27 | Variant 2                                  | FieldQtyVar2 | 75.000 *          | F                 | FYCVAL(@ProdQtyVar2, FYYR - lag) |

#### FYCVAL(@ProdQtyVar1, FYYR - lag)

- Use the FYCVal() and FYYR functions, and the created Lag variable to shift out the Production schedule
  - This produces the Fielding schedule

11

|    | WBS/CES Description                        | Unique ID      | Point<br>Estimate | Phasing<br>Method | Equation / Throughput                   |
|----|--|----------------|-------------------|-------------------|---|
| 25 | FIELDING QUANTITY SCHEDULE                 | FieldQty       | 225.000 *         |                   |   |
| 26 | Variant 1                                  | FieldQtyVar1   | 150.000 *         | F                 | FYCVAL(@ProdQtyVar1, FYYR - lag)        |
| 27 | Variant 2                                  | FieldQtyVar2   | 75.000 *          | F                 | FYCVAL(@ProdQtyVar2, FYYR - lag)        |
| 28 |  |                |                   |                   |   |
| 29 | System Operational Life                    | sys_life       |                   | С                 | 20                                      |
| 30 |  |                |                   |                   |   |
| 31 | SUSTAINMENT QUANTITY SCHEDULE (Cumulative) | SustainQty     | 4,500.000 *       |                   |   |
| 32 | Variant 1                                  | SustainQtyVar1 | 3,000.000 *       | F                 | OpFieldedUnits(@FieldQtyVar1, Sys_Life) |
| 33 | Variant 2                                  | SustainQtyVar2 | 1,500.000 *       | F                 | OpFieldedUnits(@FieldQtyVar2, Sys_Life) |

#### **OpFieldedUnits(@FieldQtyVar1, Sys\_Life)**

- Use the OpFieldedUnits() function and the created System Life variable to make ACE produce the Sustainment schedule
  - The Sustainment schedule should begin in the same year as the fielding schedule

|    | Row | Cost Element                               | Approp | Total     | FY 2012 | FY 2013 | FY 2014 | FY 2015 | FY 2016 | FY 2017 | FY 2018 | FY 2019       |
|----|-----|--|--------|-----------|---------|---------|---------|---------|---------|---------|---------|---------------|
| 1  | 19  | PRODUCTION QUANTITY SCHEDULE               |        | 225.000   | 15.000  | 30.000  | 45.000  | 60.000  | 75.000  |         |         |               |

| 4  | 22  | EQUA                                       |        |           |         |         |         |         |         |         |         |               |
| 5  | 23  | System Production to Fielding Lag in Years | 1      | 1.000     |         |         |         |         |         |         | 6       |               |
| 6  | 24  |  |        |           |         |         |         |         |         |         |         |               |
| 7  | 25  | FIELDING QUANTITY SCHEDULE                 |        | 225.000   |         | 15.000  | 30.000  | 45.000  | 60.000  | 75.000  |         |               |
| 8  | 26  | Variant 1                                  |        | 150.000   |         | 10.000  | 20.000  | 30.000  | 40.000  | 50.000  |         |               |
| 9  | 27  | Variant 2                                  |        | 75.000    |         | 5.000   | 10.000  | 15.000  | 20.000  | 25.000  |         |               |
| 10 | 28  |  |        |           |         |         | j       |         |         |         | ĺ.      |               |
| 11 | 29  | System Operational Life                    |        | 20.       |         |         |         | CU      | MULA    | ALIVE   |         |               |
| 12 | 30  |  |        |           |         |         |         |         |         |         |         | $\rightarrow$ |
| 13 | 31  | SUSTAINMENT QUANTITY SCHEDULE (Cumulative) | l í    | 4,500.000 |         | 15.000  | 45.000  | 90.000  | 150.000 | 225.000 | 225.000 | 225.000       |
| 14 | 32  | Variant 1                                  |        | 3,000.000 |         | 10.000  | 30.000  | 60.000  | 100.000 | 150.000 | 150.000 | 150.000       |
| 15 | 33  | Variant 2                                  |        | 1,500.000 |         | 5.000   | 15.000  | 30.000  | 50.000  | 75.000  | 75.000  | 75.000        |

- The totals for the Production and Fielding schedules should match
- The Sustainment schedule should be cumulative
  - Quantities should increase until a steady-state is reached, then begin to decrease until all systems have reached the end of their operational lives

U.S. Army Materiel Command | Communications-Electronics Command

13

- There are several costs tied to the people (manpower) associated with any given program
  - Pay & Allowances (P&A), Permanent Change of Station (PCS), Temporary Duty (TDY), training, etc.
- It is simple to account for these costs in ACE, but it often requires entering methodology on many rows
- Again, fewer manual inputs yield fewer errors

|    | WBS/CES Description               | Approp | Unique ID | Point Estimate          |
|----|-----------------------------------|--------|-----------|-------------------------|
| 6  | MP DIRECT FUNDED ELEMENTS         | 2010   | MP\$      | \$ 0.000 *              |
| 7  | CREW - Combat Engineers - MOS 12B | 2010   | MPCREW\$  | \$ 0.000 *              |
| 8  | Pay and Allowances                | 2010   |           | \$ 0.000 *              |
| 9  | PCS                               | 2010   |           | <mark>\$</mark> 0.000 * |
| 10 | Training                          | 2010   |           | \$ 0.000 *              |

EXAMPLE: Estimate P&A, PCS, and training costs for 10 Combat Engineers (MOS 12B) over multiple FYs

- ACE Functions Required:
  - Matrix Column Total MATCOLTOT()
    - This function performs a vector multiplication for a column by column calculation. It returns the dot product of a column vector with a column in another matrix

#### User-Created Variables Required:

- Number of rows in the matrix
- Vector parent row
- Matrix parent row

- Build the vector and matrix sections for the manpower to be estimated
  - Specify the vector constant and number of rows in the matrix
  - Note that unique IDs in those sections should be placed on the row preceding the actual data
  - With vectors and matrices, the rows addressed @vector or @matrix are just markers for the beginning of the vector or matrix

| 68 | Number of Rows in Crew Matrix | С                 |        |              |          |          |              |

- Enter the rates for P&A, PCS, and training in the matrix via the Yearly Phasing Workscreen
  - Use the "I" phasing method, and place the values and phasing method on the child row beneath the marker row
  - Only matrix values are entered in the Yearly Phasing
     Workscreen since the vector and row counts are C-phased

P&A = MatColTot(Num\_Rows, @Vector\_CombEngE7, @Matrix\_CombEngE7, 1)

PCS = MatColTot(Num\_Rows, @Vector\_CombEngE7, @Matrix\_CombEngE7, 2)

Tng = MatColTot(Num\_Rows, @Vector\_CombEngE7, @Matrix\_CombEngE7, 3)

- In the CES, place the created variables into the MATCOLTOT function and specify the column for the manpower cost category desired
- Use the F-phasing method so that costs are applied in each FY
  - Use start and end dates where necessary

|   | Row | Cost Element                      | Approp | Total         | FY 2012 | FY 2013      | FY 2014      | FY 2015      | FY 2016      | FY 2017      | FY 2018      | FY 2019      | FY 2020      |
|---|-----|-----------------------------------|--------|---------------|---------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|
| 1 | 7   | CREW - Combat Engineers - MOS 12B | 2010   | \$ 24,138.480 |         | \$ 1,005.770 | \$ 1,005.770 | \$ 1,005.770 | \$ 1,005.770 | \$ 1,005.770 | \$ 1,005.770 | \$ 1,005.770 | \$ 1,005.770 |
| 2 | 8   | Pay and Allowances                | 2010   | \$ 23,048.400 |         | \$ 960.350   | \$ 960.350   | \$ 960.350   | \$ 960.350   | \$ 960.350   | \$ 960.350   | \$ 960.350   | \$ 960.350   |
| 3 | 9   | PCS                               | 2010   | \$ 870.240    |         | \$ 36.260    | \$ 36.260    | \$ 36.260    | \$ 36.260    | \$ 36.260    | \$ 36.260    | \$ 36.260    | \$ 36.260    |
| 4 | 10  | Training                          | 2010   | \$ 219.840    |         | \$ 9.160     | \$ 9.160     | \$ 9.160     | \$ 9.160     | \$ 9.160     | \$ 9.160     | \$ 9.160     | \$ 9.160     |

Results are consistent with expectations (rates x number of people)

- P&A rate (E7) = \$96.03K \* 10 Combat Engineers = \$960.35K
- PCS rate (E7) = \$3.62K \* 10 Combat Engineers = \$36.26K
- Training rate (E7) = \$0.91K \* 10 Combat Engineers = \$9.16K

### Using the "IF" Function with ACEIT Cases to Simplify Estimates for CBAs, BCAs, etc.

U.S. Army Materiel Command | Communications-Electronics Command

21

### Cost modeling with flexibility in mind:

- Fiscal reality and What-if scenarios
- Business Case Analysis (BCA), Cost Benefit Analysis (CBA), and Analysis of Alternatives (AoA) all represent different forms of What-If analyses

- Example will show how to utilize the IF function & FY functions in combination with ACEIT Cases to create multiple What-If scenarios and quickly calculate costs for all cases
- This approach allows for one single ACEIT model instead of multiple models

- Ground Rules & Assumptions:
  - Joint requirement for system "X"
  - The Army has established contract for New Equipment Training (NET)
  - As long as the Army is buying system "X", "sister" Services can leverage NET established by the Army. However, if the Army is not buying the system, "sister" Services will have to establish their own NET, which will increase the cost by 30% per NET, per system, and also cause a 12-month delay

#### ACE functions required:

- If(Condition, Yes [, No])
  - In our example, the condition is "If the Army is buying the System 'X':"
    - If Yes, NET cost will be \$500K
    - If No, the cost for the Services will be 30% higher and NET will be delay by 12 months
- Fiscal Year Total FYTot(@Var)
- FYCSLIP (SlipMonths, @var)
- ACEIT Cases

Next step – Add Case to your model

- Enter new case name and description
  - In our example, we will create case "Army Buy is Zero"
- New screen will open and you will be able to see your Case
- Under Input Variables section, find Production Schedule and enter 0 for the Army

| ACE 7.3 - [ACEIT CON               | FERENCE    | ECASES_06AUG2012.aceit - Inputs/Results Viewer ( | [BY2012\$K)]           |                  |          |                 |                 |                 |                 |

Results in BY\$2012 (K)

#### Summary

- Topics Covered:
  - Linking quantity schedules for Procurement, Fielding, and Sustainment
  - Using matrices to simplify manpower cost calculations
  - Using the "IF" function with multiple cases to simplify estimates for CBAs, BCAs, etc.
- Applying these methodologies in ACE should result in more efficient and dynamic cost models
